# POPULATION PROJECTIONS FOR NEW JERSEY AND COUNTIES: 1990 TO 2020

## INTRODUCTION

Population projections for the State of New Jersey and its 21 counties from 1990 through 2020 are published in this report. The projections are done by the New Jersey Department of Labor's Division of Planning and Research, Office of Demographic and Economic Analysis (ODEA). They incorporate county-level population counts by age, race, and sex from the 1980 census, as well as 1984 provisional estimates. They revise and supersede all other projections previously issued by this department. For the first time, population projections are presented through 2020 and race and labor force projections are also included.

This report is the first of two projections reports, and should fill the needs of the majority of users. It includes information excerpted from four sets of projections. The ODEA Economic-Demographic Model, designated as the preferred model, is based on both economic and demographic inputs. The Historical Migration Model was formerly called the Demographic Cohort Model and along with the Economic-Demographic Model was designated as "preferred" in this Division's last projections report in July, 1983. It is a purely demographic projection that is based on migration trends from 1970 to 1984. The last two models are included mainly for illustrative purposes. These are the Zero Migration Model, also a demographic model, which assumes no net migration at the state or county level, and the Linear Regression Model which is a straight-line extrapolation of total population from 1900 to 1984.

This report (Volume 1) contains total population for New Jersey and all counties from each of the four models. It also contains tabulations of state and county population by broad age group, race (white and nonwhite) and sex, and the total labor force, from the preferred Economic-Demographic Model. The second report contains no additional state-level information, but contains distributions of the population by age (five-year groups), race, (white and nonwhite) and sex by county. Distributions of the labor force by age, race, and sex are available from ODEA on request. All projections, except for labor force and race, are available through 2020; labor force and race projections are available through 2000.

At the request of our projections users, only one set of projections was designated as preferred. The Economic-Demographic Model was designated preferred because of the greater scope of the input information, not because of any superior predictive qualities. Also, along with the Historical Migration Model, it is a technically well-established projection technique.

Because both techniques are theoretically superior, projections users may wish to view the Economic-Demographic and Historical Migration Models as establishing a range for potential population change in the future. A narrow range is indicative that projected labor market conditions produce a migration pattern similar to the pattern prevailing in the 1970s and so far in the 1980s, and that a certain consistency exists between the economically-based migration of the Economic-Demographic Model and the demographically-based Historical Migration Model. On the other hand, a wide range indicates that projected labor market conditions produce a different migration pattern from that of the last 14 years. However, users should not attribute any predictive qualities to the projections.

## Baseline Projections--Not Forecasts and Not Goals

The numbers in this report are projections, not forecasts or predictions. A projection is the measurement of a future condition that would exist if the rules and assumptions of the method proved to be empirically valid in the future. Projections may assume continuations of past conditions, present conditions or trended changes in historical conditions. They may also assume entirely new transition rates. Given the method and the assumptions, a projection is always correct if the operations of the projection method are carried out without error. The number of possible projections for any given population is therefore infinite. A forecast, on the other hand, is a projection that is also a judgemental statement concerning the expected measurement of future conditions; it is a prediction. All forecasts are projections, but not all projections are forecasts.[1] Again, numbers in this report are projections.

Furthermore, the projections in this report are not to be interpreted as goal or policy oriented. They are not intended to constrain or to advocate specific levels of growth in any areas of the state. All series are presented as baseline, that is, independent of exogenous public or private interventionist activities of an unusual, unforeseen, or undocumented nature or magnitude. They are based primarily on identifiable, demographic and economic secular trends which have been implicitly or explicitly incorporated into the models. The greatest value of the projections is as a reference framework for planning, policy evaluation and considerations of alternative growth scenarios which could be achieved through greater or less resource development.

## No Special Adjustments

As in the last set of population projections produced in July, 1983 by this division, no special adjustments were made for future population growth associated with the Atlantic City hotel-casino industry.

Because the employment growth in the hotel-casino industry has progressed sufficiently to provide an historic data base and because of the model's economic nature, the ODEA Economic-Demographic Model can account for the anticipated population growth associated with the hotel-casino industry.

---

[1] Donald B. Pittenger, Projecting State and Local Populations, (Cambridge, Massachusetts: Ballinger Publishing Company, 1976), pp. 3-4.

To the extent that at least some of the demographic effects of the hotel-casino industry were reflected in demographic trends through 1984, the demographic impact would be included in the Historical Migration Model, and to a lesser extent in the Linear Regression Model. The first hotel-casino opened in mid-1978, three were open at the time of the 1980 Census, and ten had opened by 1984. The Zero Migration Model, of course, would not be affected by hotel-casino growth since it includes no migration. Because the Linear Regression and Zero Migration Models are included in this report mainly for illustrative purposes, no special adjustments for hotel-casinos were deemed necessary.

As in previously issued sets of projections, no special adjustments were made for the impact of the development restrictions of the Pinelands Comprehensive Management Plan.

In the case of the Pinelands, the assumption was made that growth will be redirected within the counties of the Pinelands and that the present projections do not indicate growth beyond limits imposed by the Pinelands Plan, with the possible exception of Ocean County after the year 2000 in the Historical Migration Model. The Pinelands plan seeks to allocate growth to designated "regional growth areas." The Pinelands Commission states that these areas will be more than adequate to accommodate regional housing demand projections.[2]

For the most part, the housing demand projections cited by the Commision were based on higher population projections than those reported here. For example, the population projections of the preferred Economic-Demographic Model for the year 2000 were lower than implied by the Pineland Commissions's housing projections for the year 2000 with the exception of Camden County. In two additional counties, Ocean and Gloucester, the year 2000 populations cited in the Plan were exceeded by the 2020 population in the Economic-Demographic Model by a maximum of only seven percent. All three counties contain sufficient land outside the Pinelands area to accommodate the additional growth without unprecedented land use. In the Historical Migration Model, only the projection for Ocean County implies a substantial increase in maximum population density over the population projections cited in the Plan; and almost all of this increase occurs after 2000.

## THE ODEA ECONOMIC-DEMOGRAPHIC MODEL

The ODEA Economic-Demographic Model, designated preferred, is based on standard demographic projection procedures, but assumes employment growth to be the major determinant of migration in and out of the state and the counties for persons under 65 years of age. The model is therefore driven primarily by labor demand at the state and county level--subject to one major caveat. After 2000, employment growth was constrained significantly below historic rates, to rates consistent with existing levels of national immigration, settlement patterns of immigrants from abroad, and the state's relative attraction to jobseekers from elsewhere in the nation. Low fertility rates and the aging of the "baby boom" into retirement--in the absence of loosening of immigration quotas or other unforeseen events--can be expected to constrain employment growth.

---

[2] Pinelands Commission, New Jersey Pinelands Comprehensive Management Plan, (New Lisbon, New Jersey: Pinelands Commission, 1980), p. 258.

Of course, economic growth might not be restricted even if employment growth were constrained, if productivity increased sufficiently. But, in terms of the model, labor supply constraints at the national level would restrict state and county employment and population growth after 2000, in spite of the basic demand orientation of the model.

## The Cohort-Component Method

The basic projection procedure used in this model is known as the "cohort component method," and is carried out separately for the state and the counties. For each five-year cycle of the projection, a base population distribution by age, race, and sex is "aged" five years. Each five-year age group is reduced through a survival ratio to account for mortality during the five years. Births are computed by applying five-year age-race-sex-specific fertility rates to the female age groups from 10 to 49. After adjustment for mortality through a survival ratio, the five years of births become the projected group 0 to 4 years of age. To the resulting projected population by age, race, and sex, net migrants are added. Finally, the county population in each age, race, and sex category is adjusted proportionally so that the 21 counties sum to the state population in that category. This procedure is repeated for each five-year interval in the projection period.

In the present model, the cohort-component method is applied to the household population only. The group-quarters population is assumed constant throughout the period. Specific inputs and their method of development are discussed separately below.

## Base Population

The base population used in the ODEA Economic-Demographic Model is taken from the decennial census of April 1, 1980, which provides resident population by age, sex, and race in households and group quarters. Age is defined by five-year groups from age 0 to age 85, with an open category for age 85 and over.

The definition of race requires special consideration, as race was treated differently in the census of 1980 than in previous censuses. Persons who did not classify themselves in one of the specific race categories but reported a non-racial entry (usually, but not always, a Spanish origin designation) were included in a residual "other races" category. For purposes of these projections, an adjustment was made to maintain consistency with the 1970 census. Persons in the "other races" category who identified themselves to be of Spanish origin in a separate question were distributed by race in the same proportion as persons of Spanish origin who identified their race. Persons of "other race" but not of Spanish origin were distributed in the same proportion as non-Spanish persons of identified race.[3] This race definition is reasonably consistent with the definition implied by the other inputs to the model, although ambiguity in the coding of race is a potential source of error in any race projection.

---

[3] U.S. Bureau of the Census, Current Population Reports, Series P-23, No. 139, County Intercensal Estimates by Age, Sex, and Race: 1970-1980, U.S. Government Printing Office, Washington, D.C., 1985, p. 2.

The 1980 age-race-sex distribution determined in this way was projected to 1985, and adjusted to a 1985 population by county extrapolated from the provisional 1984 estimates produced by ODEA through the Federal-State Cooperative Program for Local Population Estimates (FSCPE).[4] Thus, the base population reflects the demographic characteristics of April 1, 1980, but the total population of July 1, 1984.

## Fertility

Age-specific fertility rates by race were used to compute births to women in each five-year interval. The fertility trend was determined from the national "middle series" projections of fertility by age of mother and race.[5] Rates for the state and each county were adjusted to reflect the relationship of the state and county rates to the national rates in 1980.

As a consequence of this assumed national trend, fertility rates for whites and nonwhites converged through the projection period, declining steadily for nonwhites and increasing slightly for whites. Because the fertility of New Jersey women in 1980 was lower than national levels, the rates remained relatively low through the period, implying 1.63 children per woman among whites and 1.96 children among nonwhites in 2020. Nationally, whites and nonwhites were projected to converge to 1.9 children per woman by 2050.

## Mortality

Similar reasoning was used in the projection of mortality. Life table survival ratios by age, sex, and race were projected on the basis of the U.S. Census Bureau "Middle Mortality Assumption" for the nation, but reflecting 1980 mortality differences between New Jersey and the nation.[6] Mortality information for New Jersey in 1980 was obtained from the New Jersey Department of Health. Unlike fertility, mortality for the state was made to converge to national levels by 2000, and maintained the national trend through 2020. Differences in mortality among counties were not considered.

## Migration of Persons 65 Years of Age and Older

Migration patterns of persons 65 years of age and over are assumed to follow migration patterns estimated from trends for the period from 1970 to 1984. Rates by age, race, and sex were inferred from intercensal change in birth cohorts, and by an adjustment for the period from 1980 to 1984 based on provisional estimates of the population 65 and over.

[6] Ibid., pp. 141-143.

## Migration of Persons Under 65 Years of Age

Projected migrants of working age and children are based on the projected civilian labor market, and constitute the assumption that distinguishes this model from purely demographic models. In simple terms, an over-supply of labor relative to demand for workers results in a net out-flow of persons from the county (or state) while high demand relative to supply pulls migrants in. Net migration is therefore based on the size of the civilian labor force needed to balance the labor market.

Labor supply is estimated by applying projected labor force participation rates to persons 16 years of age and over in the population projected without migration. These rates are based on national labor force projections by age, sex, and race produced by the U.S. Bureau of Labor Statistics until 1995. After 1995, a gradual increase in labor force participation is assumed, with convergence of race-sex differentials.

Labor demand is determined by employment projections adjusted to a residence basis. Employment projections reflect the historical growth of industries in the state and counties. Until 2000, employment projections are exogenous. After 2000, state employment is constrained to maintain a constant share of a national level of employment that would be feasible under U.S. Census national "middle series" projections.[7] As stated earlier, such constraint implies a much lower rate of employment growth than historic trends would indicate. However, under existing national immigration policy, expected relative demand for labor from elsewhere in the nation, low fertility rates, and the aging of the "baby boom", such constraints were imposed. Adjustment of employment to a residence basis is necessary due to commutation across county and state boundaries.

Finally, net migration of the labor force is determined by the balance of demand and supply, allowing a level of unemployment projected for the state and counties. The resulting labor force net migrants are adjusted to include children and adults outside of the labor force, and distributed by race, sex, and age according to the patterns of the 1970s.

## ALTERNATIVE DEMOGRAPHIC MODELS

The remaining three projection models in this report present population growth scenarios that could occur under different input assumptions. The Historical Migration Model is based on the trend in net migration rates by age, race, and sex inferred from population data over the period from 1970 to 1984. Like the Economic-Demographic Model, it uses established demographic techniques. The projection results from both of these models may be used as a range for possible population change in the future. The Zero Migration Model and the Linear Regression Model are primarily illustrative, and are intended only for comparison to other models.

---

[7] *Ibid.*, pp. 73-82.

## The Historical Migration Model

Like the preferred Economic-Demographic Model the Historical Migration Model is a cohort-component projection. The assumptions regarding the base population, fertility, and mortality are the same as those of the economic model discussed above. Net migrants by age, race, and sex are determined by inference from 1970 to 1980 and from 1980 to 1985 based on two censuses and the 1984 provisional estimates, and converted to net migration rates. Rather than inferring migration under 65 by economic factors, the Historical Migration Model applies the past net migration rates directly to the population distributed at each projection interval. Migration rates are assumed to converge by race and sex, so that net migration is dependent only on age by 2020. Because perpetuation of migration differentials by county for a 36-year period was considered implausible, rates by county are assumed to converge to the rates for the state throughout the period, with complete convergence by 2030. Thus, the model is purely demographic: future components of population change are an outgrowth of past components of population change.

Once again, the county projections, especially for Ocean County, may not be compatible with Pinelands legislation. Atlantic City casino employment is not expressly taken into account, although a portion of its effect on net migration to Atlantic County was realized prior to 1984, and was therefore incorporated in the context of the model.

## The Zero Migration Model

The Zero Migration Model is presented as an illustrative projection of the population change that would occur in New Jersey and the counties in the total absence of net migration. As migration tends to be the major distinguishing factor in sub-national projection models, a model that eliminates it altogether can provide a useful analytic tool. Comparing the Zero Migration Model with either the Economic-Demographic or Historical Migration Models reveals the impact of migration on population growth according to each of the two models.

Like the two models previously discussed, the Zero Migration Model is a cohort component projection. The base population, as well as projected fertility and mortality are the same as that assumed in the previous two models. Age-race-sex-specific migration rates are all set to zero for every county.

## Linear Regression Model

The Linear Regression Model is presented primarily for comparison to the Economic-Demographic and Historical Migration Models. It hypothesizes that the population growth observed in New Jersey and the counties from 1900 to 1984 will continue until 2020. Unlike the three other models, it is not a cohort component projection, but a simple extrapolation of past total population trends. The main feature of the model is the extensive history of population change on which it is based.

The method employs ordinary least squares regression on a time series for the state and counties. Total population measured by decennial censuses from 1900 to 1980 and the 1984 provisional estimate are regressed on time, the resulting equation is applied to the time period from 1984 to 2020, and the series is adjusted to be consistent with the 1984 benchmark. County populations are adjusted to sum to the state total.

## PRESENTATION OF RESULTS

The present volume provides summary tables for each of the four models (Tables 1 through 4), as well as some detail by race, sex, and age for the preferred Economic-Demographic Model (Tables 5 through 9). In addition, projections of the total labor force are given for the preferred model (Table 10). The summary tables provide projected total population by county in five-year intervals from 1990 through 2020, as well as the 1980 census figures and the 1984 provisional estimates that form the base populations. Table 5 provides a distribution by age, race, and sex for the state only. Tables 6 through 9 provide distributions by sex, by age, and by race for the state and counties. An upward revision of the Essex County population in the 1980 census is included in the summary tables, but not in the detailed tables. This results in a discrepancy of 188 persons in the population totals for Essex County and New Jersey in 1980. Furthermore, all state and county totals were rounded to the nearest 100 persons. Race-sex-age detail for the state is rounded to the nearest 10 persons. In general, there will be small discrepancies between detailed distributions and totals due to rounding.

Volume 2 contains age-race-sex detail, five-year age groups, for each county as well as the state. Basically, Table 5 as presented here is repeated for each county. This volume is available from the Office of Demographic and Economic Analysis on request.

Also available on request, but not as a formal publication, are distributions of population and labor force by age, race, and sex according to the Historical Migration Model.

## CAUTION ON INTERPRETATION

As noted at the outset, projections are not forecasts. The publication of four series is intended partly to demonstrate the varied nature of projection models. In addition, the Economic-Demographic Model and the Historical Migration Model may be viewed as a range of population alternatives for the state and counties. The present set of projections is the first set produced by ODEA that reaches as far into the future as 2020. Particular caution is advised in interpreting results beyond 2000, as the plausibility of historically based assumptions declines with increasing departure from the base year. Projections are by their nature biased in favor of continuity. There is generally little basis for projecting substantial departures from trend, so few such departures are projected. Yet, there is little doubt that unforeseen changes in trend will occur. In particular, the assumptions in the Economic-Demographic Model including the constraint on employment growth after the year 2000 are based on current and/or recent conditions which may change dramatically.

The Division of Planning and Research hopes that users of the projections, interested agencies and individuals will comment on them. Please direct all comments, suggestions, and requests to the Office of Demographic and Economic Analysis, New Jersey Department of Labor, CN 388, Trenton, New Jersey 08625-0388.

| Sussex County | 77,528 | 116,119 | 118,900 | 131,300 | 146,100 | 159,600 | 172,900 | 185,700 | 196,100 | 204,000 |
| Union County | 543,116 | 504,094 | 506,200 | 520,600 | 534,500 | 539,700 | 540,900 | 540,000 | 531,900 | 523,900 |
| Warren County | 73,960 | 84,429 | 85,300 | 88,800 | 92,700 | 96,200 | 99,300 | 101,900 | 104,100 | 105,600 |

Notes: 1) The Economic-Demographic Model is based on projections of economic activity, as well as fertility and mortality. Migration rates for the population 65 years of age and over are inferred from the period from 1970 to 1984. For explanation, see pages 3 to 6 in the text.

2) The 1984 provisional state estimate is rounded to the nearest thousand persons. The 1984 county estimates and all projections are rounded to the nearest hundred persons. Numbers may not add due to rounding.

Table 2.

## Projections of Total Population, 1990 through 2020, New Jersey and Counties.

Historical Migration Model

| | Census April 1, 1970 | Census April 1, 1980 | Provisional Estimate July 1, 1984 | Projections to July 1 | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | 1990 | 1995 | 2000 | 2005 | 2010 | 2015 | 2020 |
| NEW JERSEY | 7,171,112 | 7,365,011 | 7,515,000 | 7,719,900 | 7,902,100 | 8,051,100 | 8,117,800 | 8,124,000 | 8,088,700 | 8,008,600 |
| Atlantic County | 175,043 | 194,119 | 200,900 | 215,200 | 226,300 | 236,000 | 243,500 | 249,300 | 254,200 | 257,700 |

| Union County | 543,116 | 504,094 | 506,200 | 538,800 | 565,900 | 593,000 | 620,100 | 647,200 | 674,300 | 701,400 |
| Warren County | 73,960 | 84,429 | 85,300 | 88,700 | 91,600 | 94,400 | 97,200 | 100,000 | 102,800 | 105,700 |

**Notes:** 1) The Linear Regression Model is a straight-line extrapolation of total population based on an ordinary-least-squares regression of total population from 1900 to 1984. For explanation, see page 7 in the text.

2) The 1984 provisional state estimate is rounded to the nearest thousand persons. The 1984 county estimates and all projections are rounded to the nearest hundred persons. Numbers may not add due to rounding.

## Table 5.

## Projections of Population by Age, Race, and Sex from 1990 through 2000, by Age and Sex from 2005 through 2020. New Jersey.

## ODEA Economic-Demographic Model (Preferred).

| Age in Years | Census of April 1, 1980 | | |
|---|---|---|---|
| | All Races | | |
| | Total | Male | Female |
| Total | 7,364,823 | 3,533,012 | 3,831,811 |
| 0-4 | 463,289 | 237,346 | 225,943 |
| 5-9 | 508,447 | 259,606 | 248,841 |

Notes: 1) All projections are rounded to the nearest hundred persons. Numbers therefore may not add due to rounding.

2) Census figures do not include an upward revision of 188 persons in Essex County. The corrected totals were 851,304 for Essex County and 7,365,011 for New Jersey. As the revision was not distributed by age, sex and race, it is not reflected in this table.

| Salem County | 73,700 | 35,300 | 38,400 | 74,100 | 35,400 | 38,600 |
| Somerset County | 296,400 | 146,700 | 149,600 | 308,400 | 152,600 | 155,800 |
| Sussex County | 196,100 | 97,100 | 99,000 | 204,000 | 100,700 | 103,300 |
| Union County | 531,900 | 254,700 | 277,200 | 523,900 | 251,000 | 272,900 |
| Warren County | 104,100 | 50,000 | 54,000 | 105,600 | 50,700 | 54,800 |

Notes: 1) All projections are rounded to the nearest hundred persons. Numbers therefore may not add due to rounding.

## Table 7 .
## Projected Population of New Jersey and Counties by Age Group, 1990 through 2020.

### ODEA Economic-Demographic Model (Preferred).

| | Census of April 1, 1980 | | | | | |
|---|---|---|---|---|---|---|
| | Total Population | Under 5 | 5 to 14 | 15 to 44 | 45 to 64 | 65 and over |
| NEW JERSEY | 7,364,823 | 463,289 | 1,114,288 | 3,303,209 | 1,624,266 | 859,771 |
| Atlantic County | 194,119 | 11,774 | 29,039 | 81,422 | 41,097 | 30,787 |
| Bergen County | 845,385 | 41,969 | 111,427 | 367,983 | 218,730 | 105,276 |
| Burlington County | 362,542 | 24,781 | 59,697 | 177,736 | 71,646 | 28,682 |
| Camden County | 471,650 | 34,081 | 76,106 | 211,830 | 100,401 | 49,232 |
| Cape May County | 82,266 | 4,736 | 10,528 | 31,623 | 18,646 | 16,733 |
| Cumberland County | 132,866 | 9,573 | 22,780 | 57,798 | 27,199 | 15,516 |
| Essex County | 851,116 | 57,355 | 134,922 | 377,836 | 182,242 | 98,761 |
| Gloucester County | 199,917 | 15,161 | 33,484 | 93,882 | 39,667 | 17,723 |
| Hudson County | 556,972 | 37,306 | 78,763 | 246,956 | 124,015 | 69,932 |
| Hunterdon County | 87,361 | 5,485 | 14,566 | 41,559 | 17,647 | 8,104 |
| Mercer County | 307,863 | 18,273 | 44,080 | 142,852 | 67,458 | 35,200 |
| Middlesex County | 595,893 | 34,797 | 86,173 | 289,020 | 133,171 | 52,732 |
| Monmouth County | 503,173 | 31,423 | 82,161 | 224,005 | 106,048 | 59,536 |
| Morris County | 407,630 | 24,081 | 66,852 | 194,218 | 86,683 | 35,796 |
| Ocean County | 346,038 | 23,282 | 51,280 | 132,506 | 67,161 | 71,809 |
| Passaic County | 447,585 | 30,261 | 68,075 | 199,662 | 96,446 | 53,141 |
| Salem County | 64,676 | 4,669 | 10,603 | 27,913 | 13,953 | 7,538 |
| Somerset County | 203,129 | 11,088 | 30,660 | 94,378 | 48,721 | 18,282 |
| Sussex County | 116,119 | 9,500 | 21,094 | 56,038 | 19,352 | 10,135 |
| Union County | 504,094 | 28,083 | 68,525 | 216,523 | 126,296 | 64,667 |
| Warren County | 84,429 | 5,611 | 13,473 | 37,469 | 17,687 | 10,189 |

Notes: 1) All projections are rounded to the nearest hundred persons. Numbers therefore may not add due to rounding.

2) Census figures do not include an upward revision of 188 persons in Essex County. The corrected totals were 851,304 for Essex County and 7,365,011 for New Jersey, as shown in tables 1-4. As the revision was not distributed by age, it is not reflected in this table.

# POPULATION PROJECTIONS FOR NEW JERSEY AND COUNTIES: 1990 TO 2020

## INTRODUCTION

Population projections for the State of New Jersey and its 21 counties from 1990 through 2020 are published in this report. The projections are done by the New Jersey Department of Labor's Division of Planning and Research, Office of Demographic and Economic Analysis (ODEA). They incorporate county-level population counts by age, race, and sex from the 1980 census, as well as 1984 provisional estimates. They revise and supersede all other projections previously issued by this department. For the first time, population projections are presented through 2020 and race and labor force projections are also included.

This report is the second in a two-volume series of projection reports. It contains greater age-race-sex detail at the county level than volume 1. While most of this volume relates to a single preferred model, the ODEA Economic Model, it contains summary tables for four separate models. The preferred Economic-Demographic Model is so named because it depends on both economic and demographic inputs. The Historical Migration Model was formerly called the Demographic Cohort Model and, along with the Economic-Demographic Model, was designated as "preferred" in this Division's last projections report in July, 1983. It is a purely demographic projection that is based on migration trends from 1970 to 1984. The last two models are included mainly for illustrative purposes. These are the Zero Migration Model, also a demographic model, which assumes no net migration at the state or county level, and the Linear Regression Model which is a straight-line extrapolation of total population from 1900 to 1984.

At the request of our projections users, only one set of projections was designated as preferred. The Economic-Demographic Model was designated preferred because of the greater scope of the input information, not because of any superior predictive qualities. Also, along with the Historical Migration Model, it is a technically well-established projection technique.

Because both techniques are theoretically superior, projections users may wish to view the Economic-Demographic and Historical Migration Models as establishing a range for potential population change in the future. A narrow range is indicative that projected labor market conditions produce a migration pattern similar to the pattern prevailing in the 1970s and so far in the 1980s, and that a certain consistency exists between the economically-based migration of the Economic-Demographic Model and the demographically-based Historical Migration Model. On the other hand, a wide range indicates that projected labor market conditions produce a different migration pattern from that of the last 14 years. However, users should not attribute any predictive qualities to the projections.

## Baseline Projections--Not Forecasts and Not Goals

The numbers in this report are projections, not forecasts or predictions. A projection is the measurement of a future condition that would exist if the rules and assumptions of the method proved to be empirically valid in the future. Projections may assume continuations of past conditions, present conditions or trended changes in historical conditions. They may also assume entirely new transition rates. Given the method and the assumptions, a projection is always correct if the operations of the projection method are carried out without error. The number of possible projections for any given population is therefore infinite. A forecast, on the other hand, is a projection that is also a judgemental statement concerning the expected measurement of future conditions; it is a prediction. All forecasts are projections, but not all projections are forecasts.[1] Again, numbers in this report are projections.

Furthermore, the projections in this report are not to be interpreted as goal or policy oriented. They are not intended to constrain or to advocate specific levels of growth in any areas of the state. All series are presented as baseline, that is, independent of exogenous public or private interventionist activities of an unusual, unforeseen, or undocumented nature or magnitude. They are based primarily on identifiable, demographic and economic secular trends which have been implicitly or explicitly incorporated into the models. The greatest value of the projections is as a reference framework for planning, policy evaluation and considerations of alternative growth scenarios which could be achieved through greater or less resource development.

## THE PROJECTION MODELS

The following is a brief summary of the major characteristics of the four projection models. A more thorough description of the models and their inputs is contained in the text portion of volume 1, pages 3 through 8. All four models have as their base population July 1, 1984 provisional estimates produced by ODEA through the Federal-State Cooperative Program for Local Population Estimates (FSCPE).[2] Distribution of the population by age, sex, and race is determined from the census of April 1, 1980. As race was treated differently in the census of 1980 than in previous censuses, an adjustment was made in the classification of race. Persons of unclassified race, most of whom were of Spanish origin, were allocated to the white and nonwhite race categories in such a way as to approximate the race definition used in the 1970 census.[3] This race definition is also reasonably consistent with the definition implied by the other inputs to the model, although ambiguity in the coding of race is a potential source of error in any race projection.

[3] U.S. Bureau of the Census, Current Population Reports, Series P-23, No. 139, County Intercensal Estimates by Age, Sex, and Race: 1970-1980, U.S. Government Printing Office, Washington, D.C., 1985, p. 2.

The ODEA Economic-Demographic Model, designated preferred, is based on standard demographic projection procedures, but assumes employment growth to be the major determinant of migration in and out of the state and the counties for persons under 65 years of age. The model is therefore driven primarily by labor demand at the state and county level--subject to one major caveat. After 2000, employment growth was constrained significantly below historic rates, to rates consistent with existing levels of national immigration, settlement patterns of immigrants from abroad, and the state's relative attraction to job-seekers from elsewhere in the nation. Low fertility rates and the aging of the "baby boom" into retirement--in the absence of loosening of immigration quotas or other unforeseen events--can be expected to constrain employment growth.

The Historical Migration Model, like the Economic-Demographic Model, is a cohort-component projection. The assumptions regarding the base population, fertility, and mortality are the same as those of the economic model discussed above. Net migrants by age, race, and sex are determined by inference from 1970 to 1980 and from 1980 to 1985 based on two censuses and the 1984 provisional estimates, and converted to net migration rates. Rather than inferring migration under 65 by economic factors, the Historical Migration Model applies the past net migration rates directly to the population distributed at each projection interval. As this model uses established demographic techniques, its results, along with those of the Economic-Demographic Model, can be viewed as a range of future population alternatives.

The Zero Migration Model is presented as an illustrative projection of the population change that would occur in New Jersey and the counties in the total absence of net migration. As migration tends to be the major distinguishing factor in sub-national projection models, a model that eliminates it altogether can provide a useful analytic tool. Comparing the Zero Migration Model with either the Economic-Demographic or Historical Migration Models reveals the impact of migration on population growth according to each of the two models. Like the two models previously discussed, it is a cohort component projection.

The Linear Regression Model is presented primarily for comparison to the Economic-Demographic and Historical Migration Models. It hypothesizes that the population growth observed in New Jersey and the counties from 1900 to 1984 will continue until 2020. Unlike the three other models, it is not a cohort component projection, but a simple extrapolation of past total population trends, as determined by ordinary least squares regression. Its main feature is the extensive history of total population data on which it is based.

As in the last set of population projections produced in July, 1983 by this division, no special adjustment was made for the employment growth brought about by the Atlantic City hotel-casino development, or the development restrictions implied by the Pinelands Comprehensive Management Plan. For explanation, see volume 1, pages 2 to 3.

## PRESENTATION OF RESULTS

The tables in the present volume are divided into three sections. Section A (Tables A-1 through A-4) contains summary tables for each of the four models, giving total population for the state and counties. April 1, 1980 census figures and July 1, 1984 provisional estimates are included. Projected population is given in five-year intervals for July 1 of 1990 through 2020. Section B, Table B-1, provides five-year age-sex-race detail for the state according to the preferred ODEA Economic-Demographic Model from 1990 through through 2000, with age-sex detail from 2005 through 2020 in five-year intervals. Section C (Tables C-1 through C-21) provides similar detail for each of New Jersey's 21 counties. In four counties, Cape May, Hunterdon, Sussex, and Warren, the nonwhite population in 1980 was deemed to be too small to produce reliable projections by age and sex. Therefore, age-sex distributions by race are omitted for these counties, although population by age and sex as well as totals by race are included. An upward revision of the Essex County population in the 1980 census is included in the summary tables, but not in the detailed tables. This results in a discrepancy of 188 persons in the population totals totals for Essex County and New Jersey in 1980. Furthermore, all state and county totals were rounded to the nearest 100 persons. Race-sex-age detail is rounded to the nearest 10 persons. In general, there will be small discrepancies between detailed distributions and totals due to rounding.

Also available on request, but not as a formal publication, are distributions of the labor force by age, race, and sex according to the Economic-Demographic Model, as well as population and labor force by age, race, and sex according to the Historical Migration Model.

## CAUTION ON INTERPRETATION

As noted at the outset, projections are not forecasts. The publication of four series is intended partly to demonstrate the varied nature of projection models. In addition, the Economic-Demographic Model and the Historical Migration Model may be viewed as a range of population alternatives for the state and counties. The present set of projections is the first set produced by ODEA that reaches as far into the future as 2020. Particular caution is advised in interpreting results beyond 2000, as the plausibility of historically based assumptions declines with increasing departure from the base year. Projections are by their nature biased in favor of continuity. There is generally little basis for projecting substantial departures from trend, so few such departures are projected. Yet, there is little doubt that unforeseen changes in trend will occur. In particular, the assumptions in the Economic-Demographic Model including the constraint on employment growth after the year 2000 are based on current and/or recent conditions which may change dramatically.

The Division of Planning and Research hopes that users of the projections, interested agencies and individuals will comment on them. Please direct all comments, suggestions, and requests to the Office of Demographic and Economic Analysis, New Jersey Department of Labor, CN 388, Trenton, New Jersey 08625-0388.

Table A-1.

## Projections of Total Population, 1990 through 2020, New Jersey and Counties.

ODEA Economic-Demographic Model (Preferred).

| | Census April 1, 1970 | Census April 1, 1980 | Provisional Estimate July 1, 1984 | Projections to July 1 | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | 1990 | 1995 | 2000 | 2005 | 2010 | 2015 | 2020 |

| Middlesex County | 583,813 | 595,893 | 617,800 | 653,600 | 690,600 | 726,600 | 760,800 | 791,800 | 819,900 | 846,000 |
| Monmouth County | 461,849 | 503,173 | 522,400 | 547,200 | 568,100 | 591,600 | 611,300 | 630,600 | 648,400 | 664,600 |
| Morris County | 383,454 | 407,630 | 417,100 | 447,100 | 479,900 | 510,500 | 540,800 | 570,500 | 590,100 | 609,000 |
| Ocean County | 208,470 | 346,038 | 371,300 | 413,300 | 449,600 | 484,400 | 515,800 | 545,900 | 572,300 | 594,300 |
| Passaic County | 460,782 | 447,585 | 457,700 | 465,000 | 468,600 | 469,100 | 466,500 | 462,000 | 451,100 | 438,700 |
| Salem County | 60,346 | 64,676 | 65,700 | 67,500 | 69,400 | 71,000 | 72,100 | 73,100 | 73,700 | 74,100 |
| Somerset County | 198,372 | 203,129 | 208,900 | 227,700 | 246,600 | 261,200 | 273,500 | 285,400 | 296,400 | 308,400 |
| Sussex County | 77,528 | 116,119 | 118,900 | 131,300 | 146,100 | 159,600 | 172,900 | 185,700 | 196,100 | 204,000 |
| Union County | 543,116 | 504,094 | 506,200 | 520,600 | 534,500 | 539,700 | 540,900 | 540,000 | 531,900 | 523,900 |
| Warren County | 73,960 | 84,429 | 85,300 | 88,800 | 92,700 | 96,200 | 99,300 | 101,900 | 104,100 | 105,600 |

**Notes:** 1) The Economic-Demographic Model is based on projections of economic activity, as well as fertility and mortality. Migration rates for the population 65 years of age and over are inferred from the period from 1970 to 1984.

2) The 1984 provisional state estimate is rounded to the nearest thousand persons. The 1984 county estimates and all projections are rounded to the nearest hundred persons. Numbers may not add due to rounding.

Table A-2.

## Projections of Total Population, 1990 through 2020, New Jersey and Counties.

Historical Migration Model

|  | Census April 1, 1970 | Census April 1, 1980 | Provisional Estimate July 1, 1984 | Projections to July 1 |  |  |  |  |  |  |
|---|---|---|---|---|---|---|---|---|---|---|

**Notes:** 1) The Linear Regression Model is a straight-line extrapolation of total population based on an ordinary-least-squares regression of total population from 1900 to 1984.

2) The 1984 provisional state estimate is rounded to the nearest thousand persons. The 1984 county estimates and all projections are rounded to the nearest hundred persons. Numbers may not add due to rounding.

Notes: 1) All projections are rounded to the nearest hundred persons. Numbers therefore may not add due to rounding.

2) Race distributions do not conform to the 1980 census, but were adjusted to conform to the 1970 Census definition of race.

3) Population by age, race, and sex is suppressed for Cape May, Hunterdon, Sussex, and Warren Counties due to the small number of non-white residents in 1980.

Notes: 1) All projections are rounded to the nearest hundred persons. Numbers therefore may not add due to rounding.

2) Race distributions do not conform to the 1980 census, but were adjusted to conform to the 1970 Census definition of race.

3) Census figures do not include an upward revision of 188 persons in Essex County. The corrected total was 851,304.

| 65+ | 13,670 | 5,370 | 8,300 | . | . | . | . | . | . |

Notes: 1) All projections are rounded to the nearest hundred persons. Numbers therefore may not add due to rounding.

2) Race distributions do not conform to the 1980 census, but were adjusted to conform to the 1970 Census definition of race.

3) Population by age, race, and sex is suppressed for Cape May, Hunterdon, Sussex, and Warren Counties due to the small number of non-white residents in 1980.

| 85+ | 1,300 | 310 | 990 | . | . | . | . | . | . |
| 65+ | 13,000 | 4,920 | 8,080 | . | . | . | . | . | . |

Notes: 1) All projections are rounded to the nearest hundred persons. Numbers therefore may not add due to rounding.

2) Race distributions do not conform to the 1980 census, but were adjusted to conform to the 1970 Census definition of race.

3) Population by age, race, and sex is suppressed for Cape May, Hunterdon, Sussex, and Warren Counties due to the small number of non-white residents in 1980.
